

PI HISTORIAN TAG CROSS REFERENCING

key

CASE STUDY

Our Goal:

The overall project goal is to automatically historise all important data from site control systems.

The goal of this component was to have a method of identifying if the PLC data is important

Our Solution:

Using the raw site PLC file to test whether a tag is used at all in the PLC logic, if so, it is deemed important enough to include.

A simple solution implemented with knowledge on how the PLC export file is structured and implemented in a very short space of time – one day.

Unlocked Potential:

Innovation and exceeding expectations to encourage like-minded problem solving.

We pushed to have it integrated into the overall project delivery so that it can be handed over to the client for long term sustainable use.

Andre Gibson

Co-founder & Director
Principal Process Control Engineer

Key Insight:

“Multiple benefits can be seen when other users are trouble shooting, searching for information and will combine and continue to provide long term benefit.”
